

Content strategy and site diagram

Goals of the website:

This website is meant to connect audiences of this website to the best anime the world has to offer. It provides different kinds of anime available along with the different genres they fall under.

Scope of the website:

This website has six web pages namely:

1. The front page of the website which is named the index.html
2. The second page which will be the homepage will be named as home.html.
3. The other remaining pages are: fan favourite.html
4. Genre.html
5. Anime movies.html
6. And lastly the list of anime.html

As you can see all these web pages end with HTML so that they can all connect to the index page. All these pages will be accompanied by their own CSS file to make it easier to make each of these pages unique.

The first step is to create the basic structure of an HTML for each of the web pages. The next step is to edit the HTML structure so that we can make a complete webpage. The first step is to add the list for each of the web pages, for links we are going to use references so that the lists that link will be able to direct us to where we want to go/ to the webpage we want to go to. The next step is to add id, article, nav, and headings.

For the CSS code, the first step is to start with the background, we will put a different picture at the background of each web page. The next step is to edit the background picture so that it complements the website, we can use background size, position, attachment, and repeat.

The next important step is to focus on the text, when it comes to text, we must consider factors such as fonts, margin, and padding as well as line height. We must therefore provide the appropriate font, margins, padding, and line heights for each webpage. To make the text look more modern we are going to use the text-shadow each in different shades that suit the font colour.
